

# Analyzing Wage Variance in Israel Relative to the OECD, Focusing on the Lower Part of the Wage Distribution

Yuval Mazar, Bank of Israel  
Avi Fleishon  
Director, Data products, JDC- TEVET

September 2023

with special thanks to Victoria Bakish

# What we know from previous studies

# This study

- This paper provides an initial analysis of the link between skills level and wage level.
- Schwartz (2021) found that in Israel, despite the low skills level, the labor market has a high skills surplus, and that the utilization of workers' skills is low and inefficient relative to the OECD.
- We point to a unique situation in Israel, in which there is a significant group of workers with wages that are lower than their measured skill-level peers – the human capital level that we can measure according to the PIAAC survey.

# This study

- This study uses the results of the PIAAC survey – a shared micro database of Israel and the other OECD countries. We first show that the wage variance in Israel is higher than in other OECD countries, both without control of the explanatory variables on wages and with control. This finding is found to be robust to various tests and models.
- Due to the lower labor productivity in Israel than in other OECD countries, we focus on the lower part of the unexplained wage variance. Specifically, we test the rate of low-wage earners in Israel by international comparison, while controlling for worker characteristics, including education level, skill level, age, and gender.

# The main findings

- About 17 percent of male workers and 14 percent of female workers in Israel earn significantly less than their expected wage.
- This population generally has semiacademic education, is older, includes a relatively high percentage of Arabs, works in industries and professions with lower wages and productivity, works close to their homes, and has little professional training.
- This rate in Israel is much higher than the OECD average. This remains true even given the unequal wage distribution in Israel.
- Increasing the earning power of those workers will lead to significant improvement in per capita GDP in Israel.

# The rest of the presentation

- Presenting the basic model
- Specification of the population groups
- International comparison
- Investment in human capital, professional training

# Even after controlling for human capital, the wage distribution in Israel is less equal

1 of 2

# Even after controlling for human capital, the wage distribution in Israel is less equal

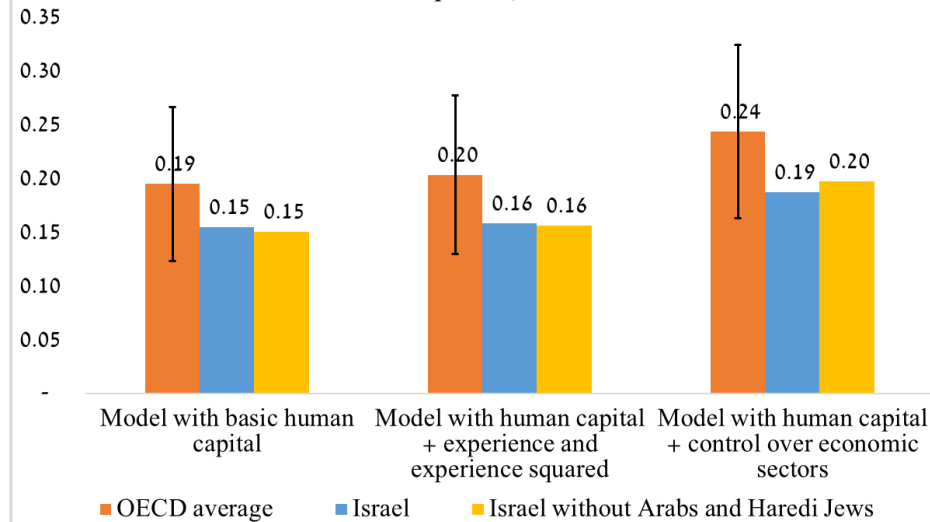

2 of 2

R-squared, Women

The margin of error represents a range of one standard deviation above and below the OECD average.

R-squared, Men

The margin of error represents a range of one standard deviation above and below the OECD average.

# The main idea

- Using individualized data (from the PIAAC survey), we can test workers' expected wages (regression) and define a group with “significantly” lower wages than their expected wage.
- In the next stage, we can specify them and compare them to other countries.

# Presentation of the model

# The basic model (with education)

$$\ln(W_{ij}) = \alpha_j + \beta_j S_{ij} + \delta_j X_{ij} + \epsilon_{ij}$$

$W$  – Individual's hourly wage

$S$  – Workers' human capital: Their base skills according to the PIAAC survey (average numeracy and literacy skills), as well as age and education. This is the **measured human capital**.

$X$  – Other variables that can influence wages (Arab, Haredi, and more).

# Calculation of the wage that is in line with human capital and group definition

$$\widehat{W}_i = \beta S_i + \delta X_i$$

We define an employee with the potential to increase

$$P_i = 1 \text{ IFF } \frac{W_i}{\widehat{W}_i} < (1 - K)$$

Specification of this group compared to the other workers is via a group of variables M.

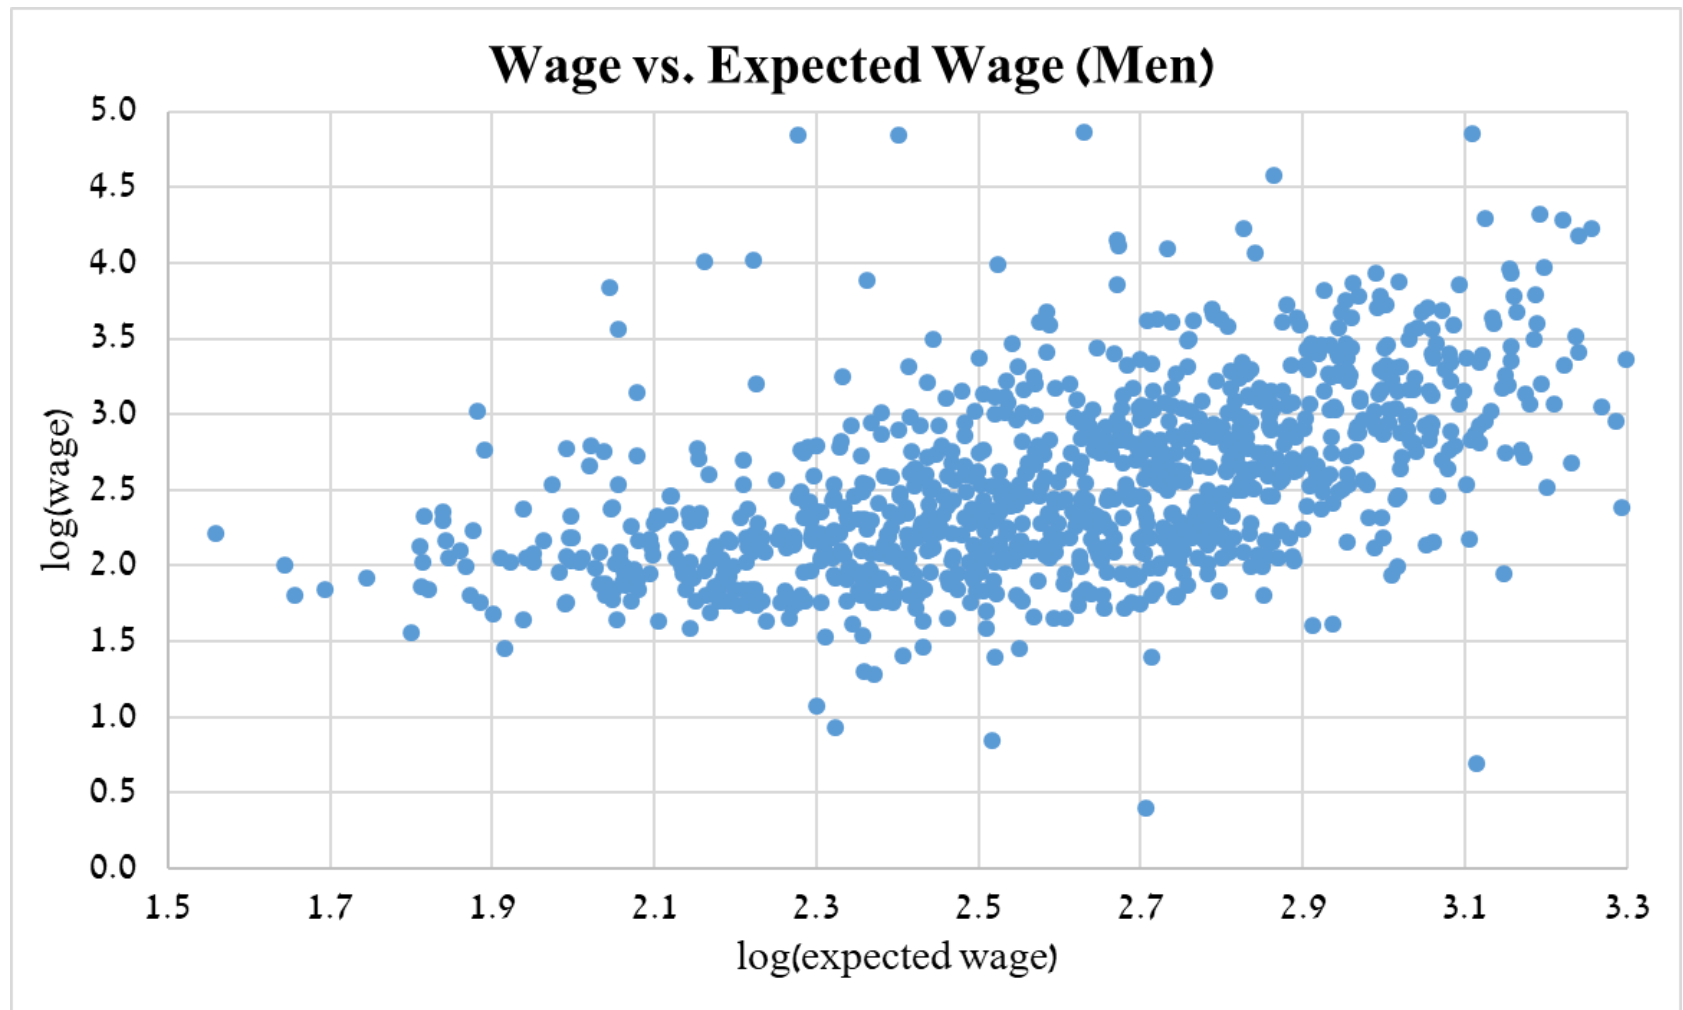

# Results of the base model

# The model – graphic illustration

# The model – graphic illustration

**We defined a wage that is 40 percent lower than the predicted wage as having the potential for a wage increase.**

# Target population: 17 percent of men and 14 percent of women

# Specification of the target population

Among the “potentials”, 57 percent have low wages (92 percent among women). Among those with low wages, 57 percent have potential (44 percent among women).

# Different from low wages, testing via the localities socioeconomic ranking.

### Women

Source: PIAAC survey 2014-2015

### Men

Source: PIAAC survey 2014-2015

# Initial findings regarding this population, men

	Employees earning significantly lower wages than expected	Employees with low wage**	Employees whose wages are not significantly lower than expected
Share (%)	17.4	17.5	
Hourly wage (₪)	25.9	22.6	60.8
Skills	253.3	220.5	254.4
Share of Arabs (%)	26.7	35.9	15.7
Share of Haredi Jews (%)	4.4	7.5	4.7
Age (years)	44	38	40
Professional experience (years)	23	18	20
Education (years)	13.2	11.4	13.1
Public sector (%)	26.1	19.4	29.3
Share of employees who have undergone professional training (%)	20.4	11.1	33.8
Work where they live (%)	52.0	47.3	28.0
N	184	219	857

# Comparison of populations, women

	<b>Employees earning significantly lower wages than expected</b>	<b>Employees with low wage**</b>	<b>Employees whose wages are not significantly lower than expected</b>
<b>Share (%)</b>	14.2	29.5	
<b>Hourly wage (₪)</b>	21.7	23.0	48.9
<b>Skills</b>	250.1	227.3	249.8
<b>Share of Arabs (%)</b>	11.4	13.6	7.7

# Rate of those with lower than expected wages, by population group

# International comparisons

# Rate of workers with significantly lower than expected wages, international comparison

**Women**

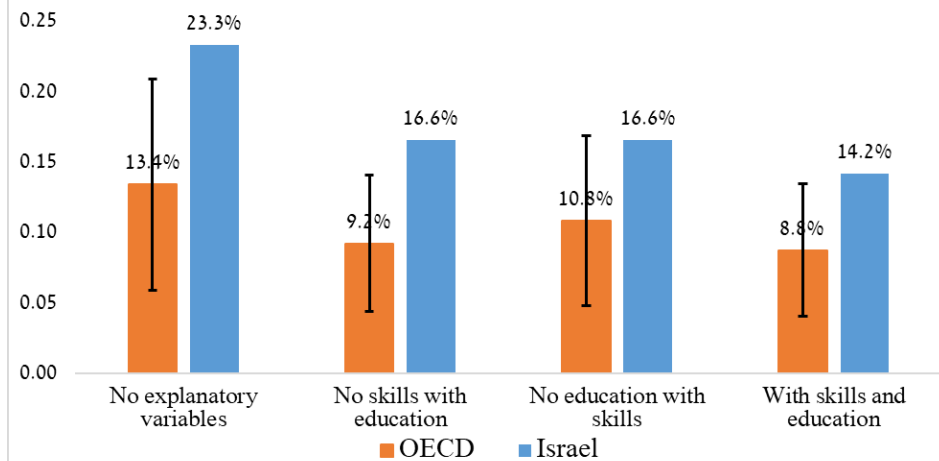

**Men**

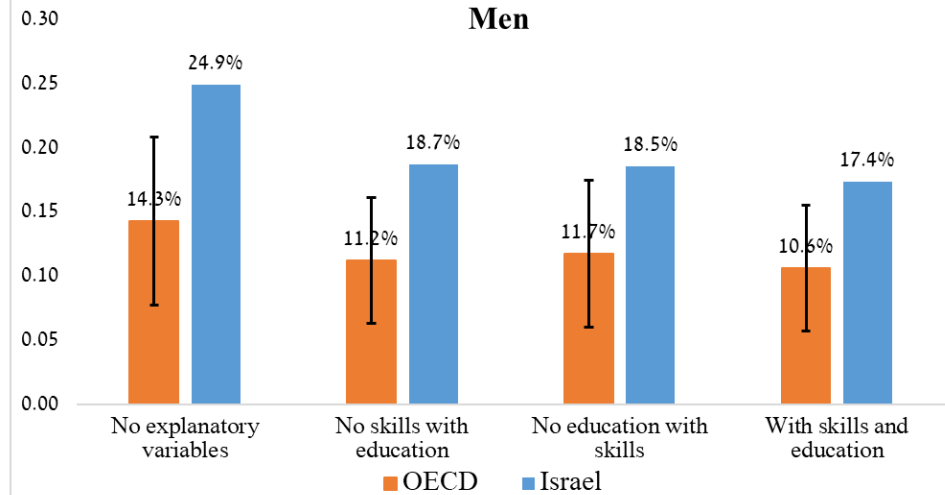

# Rate of workers with significantly lower than expected wages, with various specifications to control for human capital, international comparison

## Women

The margin of error represents a range of one standard deviation above and below the OECD average.

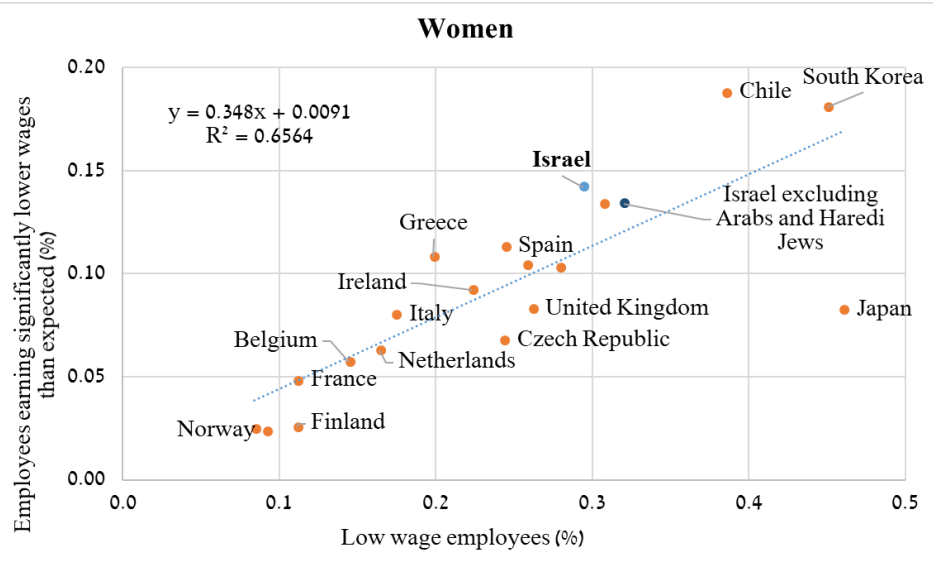

## Men

The margin of error represents a range of one standard deviation above and below the OECD average.

There is a strong correlation between the rate of workers with lower than expected wages and the rate of workers who receive low wages.

**The rate of workers with lower than expected wages VS the rate of workers who receive low wages, Israel & OECD countries**

# The international comparison shows there there is potential for GDP growth.

If the rate of workers earning less than potential (40 percent) were similar to the rate of workers earning less than potential in the OECD, it would mean wages increases for **5.9 percent of men and 5.1 percent of women.**

1. If we raise the wage to the lower bound (conservative estimate), we would obtain an additional **1.6 percent of GDP.**
2. If we raise the wage to the potential wage, we would obtain an additional **6.2 percent of GDP.**

# There is high variance between the industries.

Industries for which N<20 were removed.  
 The confidence interval is a range of one standard deviation around the OECD average

Industries for which N<20 were removed.  
 The confidence interval is a range of one standard deviation around the OECD average

# The rate of workers with significantly lower than expected wages, with different returns on education and skills between industries

# Multi-year model, Israel's coefficient

$$P(\text{Low\_wage}_{ij}) = \delta_j + \beta_j X_{ij} + \epsilon_{ij}$$

## Estimating **Israel's** coefficient in the joint international regression

	Basic model - equation 1 (I)	Basic model with control on industries (II)	Basic model with control on industries and occupation (III)	Model with all explanatory variables (IV)	Basic model + indicator for low wage (V)	Low wage as an explanation of the gap between Israel and the other countries (VI)

# Additional tests

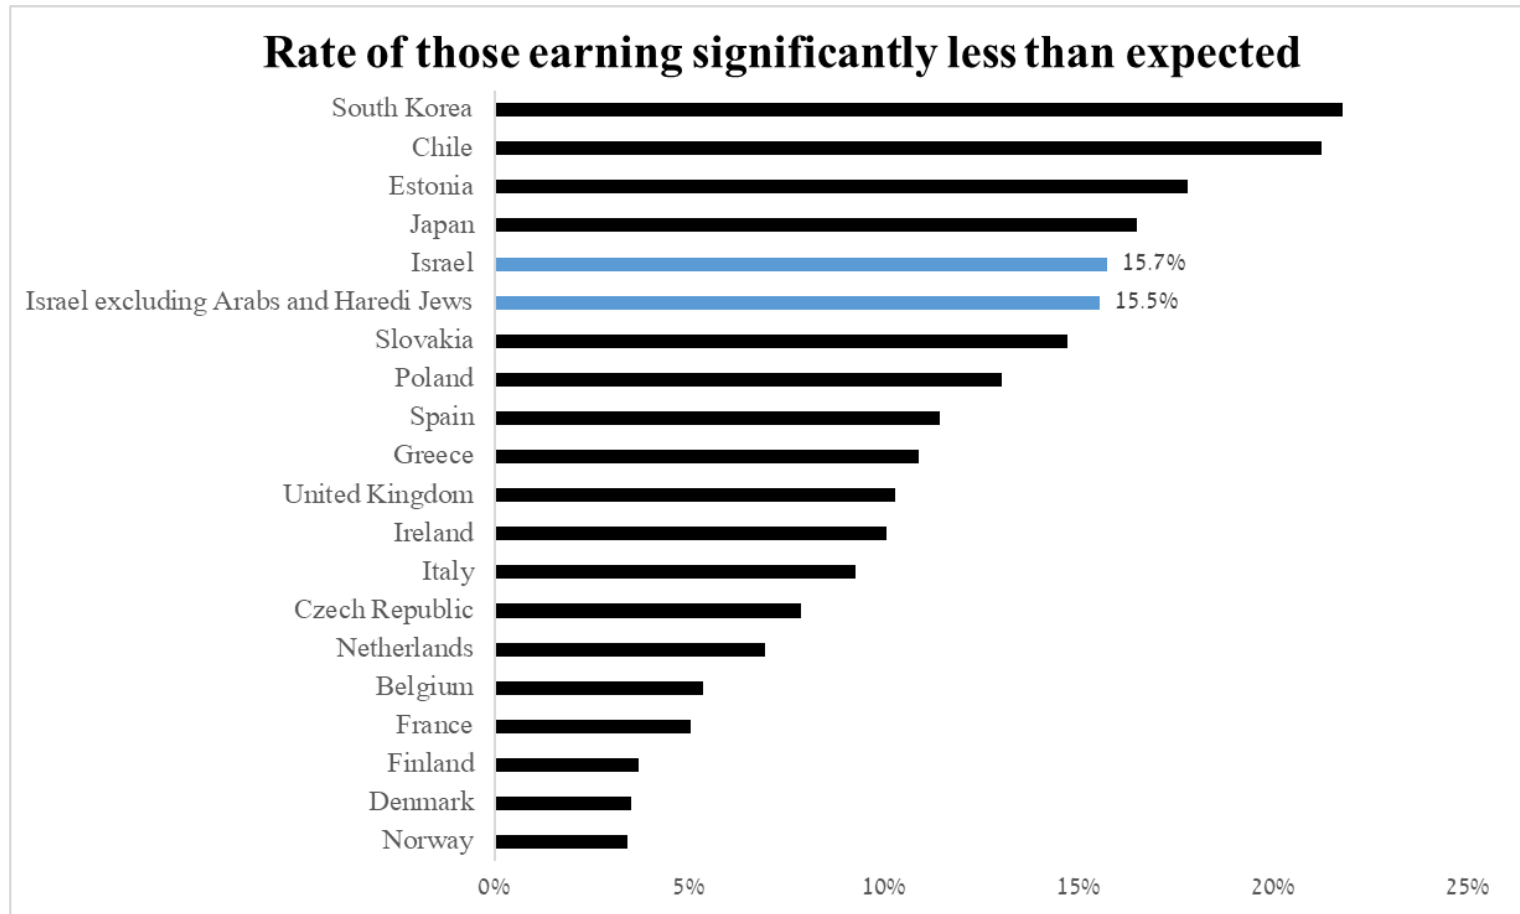

# Rate of workers with wages 30 percent lower than expected

# Rate of workers with wages 50 percent lower than expected

# \* Excluding control for women, Haredi Jews, and Arabs

# Conclusion and implications for the future

- Until now, we have known from previous studies that labor productivity in Israel is low due to the low ratio of capital per worker, low worker skills (human capital), and issues having to do with the ease of doing business.
- This study shows for the first time that **even given the human capital of workers**, Israel has a relatively high rate of workers with unutilized human capital.
- It seems that channeling and guiding these workers at the start of their careers can improve the situation in Israel from this standpoint, which would contribute to increasing labor productivity in Israel and to improved quality of life.

# Policy directions for reducing the target group

- Investment in guidance for new workers (in accordance with the OECD's Career Guidance surveys).
- Providing access to decision-supporting information on the return to schooling and career paths.
- Incentives to choose study and professional training paths with high returns for the individual.
- Lifelong learning – investment in professional retraining and professional refreshment for older workers.
- Investment in smart transport to employment areas.
- Investment in “remote work” infrastructure for the social and geographic periphery.
- Encourage the adoption of technology in low-productivity industries.

Thank you!
